

Coding & Solution

Date	28 September 2026
Team ID	6ab220cfbee0b08a2d2c63cd
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Coding & Solution

Coding:

The system uses coding to automatically read the user's ticket and identify its **category, priority, and support team**.

Example:

“I cannot login to my account.”

The system processes it as:

- **Category:** Login Issue
- **Priority:** High
- **Team:** IT Support

Solution:

The project reduces manual ticket classification by automatically:

Create Ticket → Analyze Ticket → Classify → Set Priority → Assign Team → Track Status

So, the main solution is to **automatically classify and route support tickets quickly and accurately**.

Instructions:

Instruction	Explanation for Our Project
1. Well-structured	The code should be organized properly into modules such as Ticket

and commented code	Creation, Classification, Priority Detection, Team Assignment, and Ticket Tracking. Comments should explain important parts of the code.
2. Address the core problem	The system should automatically analyze support tickets, identify the category and priority, and assign them to the appropriate support team , reducing manual work.
3. Include all required files	Provide all source files, configuration files, database files, and setup instructions required to run the Auto Ticket Classification application.
4. Code repository	Upload the complete project code to a GitHub repository and provide the repository link in the project documentation/table.

Solution Summary:

Field	Details
Repository Link / URL	Paste your GitHub repository link here. If you have not created one yet, write “To be added”.
Programming Language(s)	Python, JavaScript <i>(use only the languages actually used in your project)</i>
Framework(s) Used	FLOW DESIGNER <i>(and mention any framework such as Flask/React only if you actually used it)</i>
Key Features Implemented	User login, ticket creation, automatic ticket classification, priority detection, team assignment, ticket tracking, and admin dashboard.
Pending / Incomplete Features	Features that are not completed yet, such as advanced AI/ML classification, email notifications, or detailed reports. If everything is complete, write “None”.
Setup / Run Instructions	Open the project in FLOW DESIGNER, configure the required components/database, run the application, and test by creating a support ticket.

Code Quality Checklist:

S.No	Criteria	Status
1	Code is modular and organized into functions/classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments/documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes / No (<i>Yes only if uploaded to GitHub/GitLab</i>)

Additional Notes / Comments:

The Auto Ticket Classification system is organized into separate modules for ticket creation, classification, priority detection, team assignment, and ticket tracking. Meaningful names and comments are used to make the code easy to understand and maintain. Error handling is included for important operations, and the application is tested to ensure it runs without critical errors. The source code is maintained in a version control repository.
